K3. Vi ska ta ett (eller två) steg med gradientmetoden för att träna upp ett litet neuronät $y = f(\bar{x})$. Antag att det finns två träningspunkter, $\tilde{x} = \begin{pmatrix} -1 \\ 1 \end{pmatrix}$ ska ge $\tilde{y} = -2$ och $\hat{x} = \begin{pmatrix} 3 \\ -1 \end{pmatrix}$ ska ge $\hat{y} = 2$. Neuronätet har två lager, $f(\bar{x}) = f_2(\bar{f}_1(\bar{x}))$, där $\bar{f}_1(\bar{x}) = \bar{\sigma}(A_1\bar{x})$ med $A_1 = \begin{pmatrix} w_1 & w_2 \\ w_3 & w_4 \end{pmatrix}$ och $\bar{\sigma}\left(\begin{pmatrix} t_1 \\ t_2 \end{pmatrix}\right) = \begin{pmatrix} \sigma(t_1) \\ \sigma(t_2) \end{pmatrix} = \begin{pmatrix} \max(t_1, 0) \\ \max(t_2, 0) \end{pmatrix}$, $f_2(\bar{u}) = A_2\bar{u}$ med $A_2 = (w_5 \quad w_6)$.

Vi vill minimera $\ell(\bar{w}) = \frac{1}{2}[(f(\tilde{x}, \bar{w}) - \tilde{y})^2 + (f(\hat{x}, \bar{w}) - \hat{y})^2]$ där $\bar{w} = (w_1, w_2, w_3, w_4, w_5, w_6)$.

Som startpunkt i \mathbb{R}^6 har vi $\bar{w}_{(0)} = (1, 2, -1, 1, 1, -2)$.

Ange matriserna A_1 och A_2 i startpunkten och beräkna $\tilde{t} = A_1\tilde{x}$, $\hat{t} = A_1\hat{x}$, $\tilde{u} = \bar{\sigma}(\tilde{t})$, $\hat{u} = \bar{\sigma}(\hat{t})$, $f(\tilde{x}) = A_2\tilde{u}$ och $f(\hat{x}) = A_2\hat{u}$. Vad blir $\ell(\bar{w}_{(0)})$?

Beräkna $\nabla\ell(\bar{w}_{(0)})$ och bestäm en ny punkt $\bar{w}_{(1)} = \bar{w}_{(0)} - \eta\nabla\ell(\bar{w}_{(0)})$ för $\eta = 0.1$.

I punkten $\bar{w}_{(1)}$, ange \tilde{t} , \hat{t} , \tilde{u} , \hat{u} , $f(\tilde{x})$, $f(\hat{x})$, $\ell(\bar{w}_{(1)})$ och $\nabla\ell(\bar{w}_{(1)})$.

Extra: Ta steget till nästa punkt $\bar{w}_{(2)}$ och beräkna $\ell(\bar{w}_{(2)})$. Jämför resultaten för $\eta = 0.1$ och $\eta = 0.05$ i detta steg.

K4. Beräkna största och minsta värde av $f(x, y) = 2x - y$ under bivillkoret att $g(x, y) = 4x^2 + y^2 = 8$.

K5. Beräkna, eller visa divergens av, följande generaliserade integraler :

a) $\iint_D \frac{dxdy}{x^2(1+y^2)}$, $D = \{(x, y) \in \mathbb{R}^2; x \geq 1\}$

b) $\iint_D \frac{y}{(x^2+y^2)^2} dxdy$, $D = \{(x, y) \in \mathbb{R}^2; y \geq 0, x^2+y^2 \geq a > 0\}$

c) $\iint_D \frac{dxdy}{(1+x+y)^2}$, $D = \text{första kvadranten}$
