A fair die is tossed and the upper side is observed. The sample space here can be denoted as $S = \{1, 2, 3, 4, 5, 6\}$. Let us consider the following three events:

$$A = \{1, 3, 5\}, \qquad B = \{2, 4, 6\}, \qquad C = \{1, 6\}.$$

(1.1) (1p) Are the two events A and B independent? Why?
(1.2) (1p) Are the two events A and C independent? Why?
(1.3) (1p) Find the conditional probability $P(B \mid C)$.

2 (3 points)

On 22 March 2024, ICA Maxi Linköping sells (royal gala) apples. Assume that on this day the distribution X of weights (in gram) of all such apples in ICA Maxi Linköping is normal $X \sim N(150, 16)$. That is, a randomly selected such apple from ICA Maxi Linköping on 22 March 2024 has a weight according to the distribution $X \sim N(150, 16)$.
(2.1) (1p) If one buys one such apple, and let X_1 denote the weight. Find the probability that the weight of this apple is more than 162 grams.
(2.2) (2p) If one buys 9 such apples, and let $X_1, \ldots, X_9$ denote the weights. Find the probability that the total weight of these 9 apples is less than 1380 grams.

3 (3 points)

Let (X, Y) be a two dimensional random variable with the following joint probability mass function (pmf) $p(x, y)$:

$X \backslash Y$	-1	0	1
0	0.25	0	0.25
1	0	0.5	0

The table tells that X can take values 0 and 1, and Y can take values -1, 0 and 1.
(3.1) (1p) Find the probability $P(X + Y \leq 0.8)$.
(3.2) (1p) Find the marginal pmf $p_X(x)$ of X, and the marginal pmf $p_Y(y)$ of Y. Are X and Y independent? Why?
(3.3) (1p) Find the mean $\mu = E(X)$ and the variance $\sigma^2 = V(X)$ of X.

4 (3 points)

(4.1) (1p) A population X is continuous with a probability density function (pdf) given as

$$f(x) = \frac{1}{\theta}, \qquad \text{for } 0 < x < \theta,$$

where $\theta > 0$ is an unknown parameter. A sample $\{x_1, x_2, \ldots, x_n\}$ is taken from this population. Use the method of moments to find a point estimate $\hat{\theta}_{MM}$ of θ.
(4.2) (2p) Another population Y is continuous with a probability density function (pdf) given as

$$f(y) = \sqrt{\frac{2}{\pi}} \cdot \frac{y^2}{\lambda^3} \cdot e^{-\frac{y^2}{2\lambda^2}}, \qquad \text{for } y > 0,$$

where $\lambda > 0$ is an unknown parameter. A sample $\{y_1, y_2, \ldots, y_n\}$ is taken from this population. Use the maximum-likelihood method to find a point estimate $\hat{\lambda}_{ML}$ of λ.

5 (3 points)

One wants to compare the sizes of perch ('Abborre' in Swedish) in Roxen and Glan. Suppose that the distribution X of sizes of perch in Roxen is normal $X \sim N(\mu_1, \sigma^2)$, and the distribution Y of sizes of perch in Glan is also normal $Y \sim (\mu_2, \sigma^2)$. We further assume that X and Y are independent. A sample of perch from Roxen contains 8 perch with sample mean 16.5 cm, and sample standard deviation 2.8 cm. Another sample of perch from Glan contains 10 perch with sample mean 14.2 cm, and sample standard deviation 2.2 cm. Do the samples provide any evidence that the perch in Roxen are bigger than the perch in Glan? Answer this question by constructing a 95% one-sided confidence interval $I_{\mu_1-\mu_2}$ of $\mu_1 - \mu_2$ in the form $I_{\mu_1-\mu_2} = (a, \ +\infty)$. (Hint: do NOT use any language of Hypotheses Testing).

6 (3 points)

A factory produces plenty of items. The CEO of this factory claims that the defective rate p of the items is less than 1%. Now a group of statisticians is employed to check whether or not the claim of the CEO is correct, based on hypotheses testing (HT). To this end, a sample of 2000 items is selected and there are 15 defective items among them.
(Hint: $*$ Please keep as many decimals as possible during your calculation.
$*$ Pay attention to percentages, for example 1%=0.01, 0.75%=0.0075, 0.25%=0.0025, etc).
(6.1) (1p) Write down appropriate hypotheses H_0 and H_a.
(6.2) (1p) With a significance level 5%, is H_0 rejected? Why?
(6.3) (1p) Find the power $h(0.8\%)$ of the test in (6.2).

TAMS11/42: formulas and tables — by Xiangfeng Yang

1. Basic probability

(1.1) Conditional probability $P(A|B) = \frac{P(A\cap B)}{P(B)}$.
(1.2) Total probability $P(B) = \sum_{i=1}^{k} P(B|A_i)P(A_i)$ where $\{A_i\}$ are disjoint and $\cup_{i=1}^{k} A_i = S$.
(1.3) Bayes' Theorem $P(A_j|B) = \frac{P(B|A_j)P(A_j)}{\sum_{i=1}^{k} P(B|A_i)P(A_i)}$ where $\{A_i\}$ are in (1.2).

2. Random variables (r.v.s)

(2.1) Discrete r.v. X has a pmf $p(x) = P(X = x)$ satisfying $p(x) \geq 0$ and $\sum p(x_i) = 1$,

X	x_1	x_2	$\cdots$	x_n	$\cdots$
$p(x)$	$p(x_1)$	$p(x_2)$	$\cdots$	$p(x_n)$	$\cdots$

Expectation (or *Expected value* or *mean*) $\mu_X = E(X) = \sum x_i p(x_i)$;
Variance $\sigma_X^2 = V(X) = E(X-\mu_X)^2 = E(X^2) - \mu_X^2 = \sum x_i^2 p(x_i) - (\sum x_i p(x_i))^2$.
(2.2) Continuous r.v. X has a pdf $f(x)$ satisfying $f(x) \geq 0$ and $\int_{-\infty}^{\infty} f(x)dx = 1$,

$$P(a < X < b) = \int_a^b f(x)dx.$$

Expectation (or *Expected value* or *mean*) $\mu_X = E(X) = \int_{-\infty}^{\infty} xf(x)dx$;
Variance $\sigma_X^2 = V(X) = E(X-\mu_X)^2 = E(X^2) - \mu_X^2 = \int_{-\infty}^{\infty} x^2 f(x)dx - \left(\int_{-\infty}^{\infty} xf(x)dx\right)^2$.
(2.3) Cumulative distribution function (cdf) of a r.v. X is $F(x) = P(X \leq x)$.
(2.4) X and Y are r.v.s, a, b and c are scalars, then

$$E(aX + bY + c) = aE(X) + bE(Y) + c,$$
$$V(aX + bY + c) = a^2V(X) + b^2V(Y) + 2ab\, cov(X, Y),$$
$$E(g(X,Y)) = \begin{cases} \sum_{i,j} g(x_i, y_j) \cdot p(x_i, y_j), & \text{for discrete } (X,Y), \\ \int_{-\infty}^{\infty}\int_{-\infty}^{\infty} g(x,y)\cdot f(x,y)dxdy, & \text{for continuous } (X,Y). \end{cases}$$

(2.5) • Discrete r.v. (X, Y) has a joint pmf $p(x, y)$ satisfying $p(x, y) \geq 0$ and $\sum_{x_i}\sum_{y_i} p(x_i, y_i) = 1$.
The *marginal pmf* of X is $p_X(x) = \sum_y p(x, y)$;
The *marginal pmf* of Y is $p_Y(y) = \sum_x p(x, y)$;
X and Y are *independent* if $p(x, y) = p_X(x) \cdot p_Y(y)$.
• Continuous r.v. (X, Y) has a joint pdf $p(x, y)$ satisfying $f(x, y) \geq 0$ and $\int_{-\infty}^{\infty}\int_{-\infty}^{\infty} f(x, y)dxdy = 1$.
The *marginal pdf* of X is $f_X(x) = \int_{-\infty}^{\infty} f(x, y)dy$;
The *marginal pdf* of Y is $f_Y(y) = \int_{-\infty}^{\infty} f(x, y)dx$;
X and Y are *independent* if $f(x, y) = f_X(x) \cdot f_Y(y)$.

3. Several special r.v.s

(3.1) $X \sim Bin(n, p)$ has a pmf $p(x) = P(X = x) = \binom{n}{x} \cdot p^x \cdot (1-p)^{n-x}, \quad x = 0, 1, 2, \ldots, n.$
$E(X) = n \cdot p, \quad V(X) = n \cdot p \cdot (1-p)$.
(3.2) $X \sim Po(\lambda)$ has a pmf $p(x) = P(X = x) = \frac{e^{-\lambda}\lambda^x}{x!}, \quad x = 0, 1, 2, \ldots.$
$E(X) = \lambda, \quad V(X) = \lambda$.
(3.3) $X \sim Hypergeometric$ has a pmf $p(x) = P(X = x) = \frac{\binom{M}{x}\binom{N-M}{n-x}}{\binom{N}{n}}$.
(3.4) $X \sim Exp(\lambda)$ has a pdf

$$f(x) = \begin{cases} \lambda e^{-\lambda x}, & x \geq 0, \\ 0, & \text{otherwise.} \end{cases}$$

$E(X) = \frac{1}{\lambda}, \quad V(X) = \left(\frac{1}{\lambda}\right)^2$.
(3.5) $X \sim N(\mu, \sigma^2)$ has a pdf

$$f(x) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}, -\infty < x < \infty.$$

$E(X) = \mu, \quad V(X) = \sigma^2$.
(3.6) $X \sim U(a, b)$ has a pdf

$$f(x) = \begin{cases} \frac{1}{b-a}, & a < x < b, \\ 0, & \text{otherwise.} \end{cases}$$

$E(X) = \frac{a+b}{2}, \quad V(X) = \frac{(b-a)^2}{12}$.

4. Central Limit Theorem (CLT)

Suppose that a population has mean= μ and variance= σ^2. A random sample $\{X_1, X_2, \ldots, X_n\}$ from this population is given. Then for large $n \geq 30$,

$$\frac{\bar{X} - \mu}{\sigma/\sqrt{n}} \sim N(0, 1). \qquad (1)$$

- If the population is normal, then (1) holds for any n.
- Note that $\mu = E(\bar{X})$ and $(\sigma/\sqrt{n})^2 = V(\bar{X})$.

5. Several notations in statistics

(5.1) Sample mean: $\bar{X} = \frac{X_1+X_2+\ldots X_n}{n} = \frac{\sum X_i}{n}$; $\bar{x} = \frac{x_1+x_2+\ldots x_n}{n} = \frac{\sum x_i}{n}$.
(5.2) Sample variance:

$$S^2 = \frac{\sum(X_i - \bar{X})^2}{n-1} = \frac{1}{n-1}\left(\sum X_i^2 - \frac{(\sum X_i)^2}{n}\right); \quad s^2 = \frac{\sum(x_i - \bar{x})^2}{n-1} = \frac{1}{n-1}\left(\sum x_i^2 - \frac{(\sum x_i)^2}{n}\right).$$

• Capital letters $\bar{X}$ and S^2 refer to the objects based on random sample (therefore they are in general r.v.s), while small letters $\bar{x}$ and s^2 are the objects based on observations (so they are scalars).
(5.3) A point estimator of θ obtained by Methods of Moments is denoted as $\hat{\theta}_{MM}$.
(5.4) A point estimator of θ obtained by Maximum Likelihood method is denoted as $\hat{\theta}_{ML}$.

6. Confidence Interval (CI)

In this course, three types of confidence intervals are studied depending on the unknown population parameter(s): CI-1 (confidence intervals for population mean(s)), CI-2 (confidence intervals for population variance(s)), and CI-3 (confidence intervals for population propotion(s)).

CI-1: $(1-\alpha)$ **CI of a population mean** μ

case 1.1 (any n) If population $X \sim N(\mu, \sigma^2)$ and σ^2 is known, then $\frac{\bar{X}-\mu}{\sigma/\sqrt{n}} \sim N(0,1)$ and

$$I_\mu = \left(\bar{x} - z_{\alpha/2}\cdot\frac{\sigma}{\sqrt{n}}, \bar{x} + z_{\alpha/2}\cdot\frac{\sigma}{\sqrt{n}}\right) := \bar{x} \mp z_{\alpha/2}\cdot\frac{\sigma}{\sqrt{n}}.$$

case 1.2 ($n \geq 30$) For any population X, it holds that $\frac{\bar{X}-\mu}{\sigma/\sqrt{n}} \sim N(0,1)$ and

$$I_\mu = \bar{x} \mp z_{\alpha/2}\cdot\frac{\sigma}{\sqrt{n}} \text{ or } I_\mu = \bar{x} \mp z_{\alpha/2}\cdot\frac{\hat{\sigma}}{\sqrt{n}}.$$

case 1.3 (any n) If population $X \sim N(\mu, \sigma^2)$ and σ^2 is unknown, then $\frac{\bar{X}-\mu}{S/\sqrt{n}} \sim T(n-1)$ and

$$I_\mu = \bar{x} \mp t_{\alpha/2}(n-1)\cdot\frac{s}{\sqrt{n}}.$$

CI-1′: $(1-\alpha)$ **CI of the difference of two population means** $\mu_X - \mu_Y$

case 1.1′ (any n_1, n_2) If independent populations $X \sim N(\mu_X, \sigma_X^2), Y \sim N(\mu_Y, \sigma_Y^2)$, and σ_X^2, σ_Y^2 are known, then $\frac{(\bar{X}-\bar{Y})-(\mu_X-\mu_Y)}{\sqrt{\frac{\sigma_X^2}{n_1}+\frac{\sigma_Y^2}{n_2}}} \sim N(0,1)$, and $I_{\mu_X-\mu_Y} = (\bar{x}-\bar{y}) \mp z_{\alpha/2}\cdot\sqrt{\frac{\sigma_X^2}{n_1}+\frac{\sigma_Y^2}{n_2}}$.

case 1.2′ ($n_1, n_2 \geq 30$) For any independent populations X and Y, it holds that

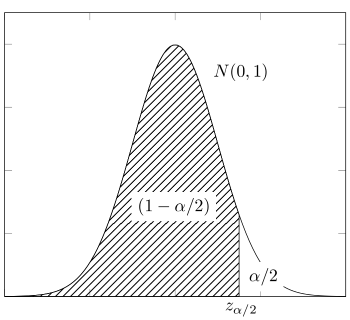
$$\frac{(\bar{X}-\bar{Y})-(\mu_X-\mu_Y)}{\sqrt{\frac{\sigma_X^2}{n_1}+\frac{\sigma_Y^2}{n_2}}} \sim N(0,1) \text{ and}$$

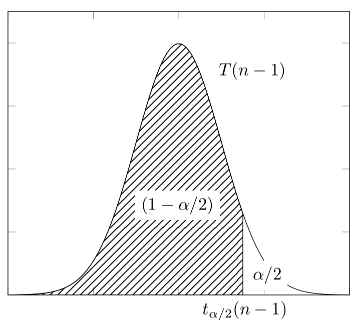
$$I_{\mu_X-\mu_Y} = (\bar{x}-\bar{y}) \mp z_{\alpha/2}\cdot\sqrt{\frac{\sigma_X^2}{n_1}+\frac{\sigma_Y^2}{n_2}} \text{ or } I_{\mu_X-\mu_Y} = (\bar{x}-\bar{y}) \mp z_{\alpha/2}\cdot\sqrt{\frac{\hat{\sigma}_X^2}{n_1}+\frac{\hat{\sigma}_Y^2}{n_2}}.$$

case 1.3′ (any n_1, n_2) If independent populations $X \sim N(\mu_X, \sigma_X^2), Y \sim N(\mu_Y, \sigma_Y^2)$, where σ_X^2, σ_Y^2 are unknown but $\sigma_X^2 = \sigma_Y^2$, then

$$\frac{(\bar{X}-\bar{Y})-(\mu_X-\mu_Y)}{S\sqrt{\frac{1}{n_1}+\frac{1}{n_2}}} \sim T(n_1+n_2-2), \text{ where } S^2 = \frac{(n_1-1)S_X^2+(n_2-1)S_Y^2}{n_1+n_2-2}, \text{ and}$$

$$I_{\mu_X-\mu_Y} = (\bar{x}-\bar{y}) \mp t_{\alpha/2}(n_1+n_2-2)\cdot s\sqrt{\frac{1}{n_1}+\frac{1}{n_2}}.$$





CI-2: $(1-\alpha)$ **CI of population variance(s)** σ^2

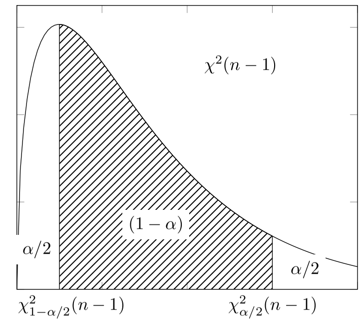
• If a population $X \sim N(\mu, \sigma^2)$ and σ^2 is unknown, then $\frac{(n-1)S^2}{\sigma^2} \sim \chi^2(n-1)$, and

$$I_{\sigma^2} = \left(\frac{(n-1)s^2}{\chi^2_{\alpha/2}(n-1)}, \quad \frac{(n-1)s^2}{\chi^2_{1-\alpha/2}(n-1)}\right).$$

• If two independent populations $X \sim N(\mu_X, \sigma^2)$ and $Y \sim N(\mu_Y, \sigma^2)$, and σ^2 is unknown, then $\frac{(n_1+n_2-2)S^2}{\sigma^2} \sim \chi^2(n_1+n_2-2)$, and

$$I_{\sigma^2} = \left(\frac{(n_1+n_2-2)s^2}{\chi^2_{\alpha/2}(n_1+n_2-2)}, \quad \frac{(n_1+n_2-2)s^2}{\chi^2_{1-\alpha/2}(n_1+n_2-2)}\right),$$

where $S^2 = \frac{(n_1-1)S_X^2+(n_2-1)S_Y^2}{n_1+n_2-2}$.



CI-3: $(1-\alpha)$ **CI of population proportion(s)**

• If a (large) population has an unknow proportion p, then $\frac{\hat{P}-p}{\sqrt{p(1-p)/n}} \sim N(0,1)$ if $n\hat{p} \geq 10$ and $n(1-\hat{p}) \geq 10$ with $\hat{p} = x/n$, and $I_p = \hat{p} \mp z_{\alpha/2}\cdot\sqrt{\frac{\hat{p}(1-\hat{p})}{n}}$.

• If two independent (large) populations have unknow proportions p_1 and p_2, then

$$\frac{(\hat{P}_1-\hat{P}_2)-(p_1-p_2)}{\sqrt{\frac{p_1(1-p_1)}{n_1}+\frac{p_2(1-p_2)}{n_2}}} \sim N(0,1)$$

if $n_i\hat{p}_i \geq 10$ and $n_i(1-\hat{p}_i) \geq 10$ for $i = 1,2$, and $I_{p_1-p_2} = (\hat{p}_1-\hat{p}_2) \mp z_{\alpha/2}\cdot\sqrt{\frac{\hat{p}_1(1-\hat{p}_1)}{n_1}+\frac{\hat{p}_2(1-\hat{p}_2)}{n_2}}$.

7. Hypothesis Test (HT)

	H_0 is true	H_0 is false and $\theta = \theta_1$
reject H_0	(type I error or significance level) α	(power) $h(\theta_1)$
don't reject H_0	$1-\alpha$	(type II error) $\beta(\theta_1) = 1 - h(\theta_1)$

reject $H_0 \Leftrightarrow TS \in C \Leftrightarrow p$-value$< \alpha$

χ^2 tests for populations (non-parametric tests)

Suppose that for a random sample of a population X, the n elements of it are classified into k disjoint groups $A_i, 1 \leq i \leq k$. For each group $A_i, 1 \leq i \leq k$, suppose that there are $N_i, 1 \leq i \leq k$ elements inside. Let $p_i = P(A_i)$ assuming a given distribution of X. Note that $p_1 + p_2 + \ldots + p_k = 1$ and $N_1 + N_2 + \ldots + N_k = n$. One wants to test the hypotheses

$$H_0 : P(A_i) = p_i, \ 1 \leq i \leq k, \quad H_a : P(A_i) \neq p_i \text{ for some } 1 \leq i \leq k.$$

If n is large in the sense that $np_i \geq 5$ for all $1 \leq i \leq k$, then the test statistic is

$$\sum_{i=1}^{k} \frac{(N_i - np_i)^2}{np_i} \approx \chi^2(k-1).$$

Therefore the observation of the test statistic is

$$TS = \sum_{i=1}^{k} \frac{(n_i - np_i)^2}{np_i}, \text{ where } n_i \text{ is the observation of } N_i, 1 \leq i \leq k.$$

For the critical region C, one can take (note that if H_0 is true, then TS should be close to zero)

$$C = (\chi^2_\alpha(k-1),\ \infty).$$

The conclusion would be $TS \in C \iff H_0$ is rejected.

8. Linear and logistic regression

(Multiple) linear regression: $Y = \beta_0 + \beta_1 x_1 + \ldots + \beta_k x_k + \varepsilon, \quad \varepsilon \sim N(0, \sigma^2)$.

- Y : response variable (which is normal r.v.), $\{x_1, \ldots, x_k\}$: predictors (which are scalars).
- sample: $\{(x_{11}, \ldots, x_{1k}; y_1), (x_{21}, \ldots, x_{2k}; y_2) \ldots, (x_{n1}, \ldots, x_{nk}; y_n)\}$.
- how to estimate $\beta_j \approx \hat\beta_j$: least square method, that is, to minimize $\sum_{i=1}^n (\hat y_i - y_i)^2$, where the estimated (multiple) linear regression line $\hat y$ is

$$\hat y = \hat\beta_0 + \hat\beta_1 x_1 + \ldots + \hat\beta_k x_k.$$

- $\frac{\hat\beta_j - \beta_j}{se(\hat\beta_j)} \sim T(n-k-1)$, this helps determine whether or not the real $\beta_j = 0$?
- $\sigma^2 \approx \frac{SS_E}{n-k-1}$, this gives an estimation of the size of the error.
- $R^2 = \frac{SS_R}{SS_T}$, this gives how well the model is (if $R^2 \approx 1$, then the model fits the sample very well).
- How to test $\beta_1 = \ldots = \beta_k = 0$? Use the random variable $\frac{SS_R/k}{SS_E/(n-k-1)} \sim F(k, n-k-1)$.

Logistic regression: Let Y can only take 0 or 1 with $P(Y=1) = p$ and $P(Y=0) = 1-p$,

$$E(Y) = p(x_1, \ldots, x_k) = \frac{e^{\beta_0 + \beta_1 x_1 + \ldots + \beta_k x_k}}{1 + e^{\beta_0 + \beta_1 x_1 + \ldots + \beta_k x_k}}.$$

- Y : response variable (which is Bernoulli r.v. $P(Y=1) = p$ and $P(Y=0) = 1-p$, so $E(Y) = p$), $\{x_1, \ldots, x_k\}$: predictors (which are scalars).
- sample: $\{(x_{11}, \ldots, x_{1k}; y_1), (x_{21}, \ldots, x_{2k}; y_2) \ldots, (x_{n1}, \ldots, x_{nk}; y_n)\}$.
- how to estimate $\beta_j \approx \hat\beta_j$: maximal likelihood method (maximize $\prod_{i=1}^n p(x_{i1}, \ldots, x_{ik})^{y_i}(1 - p(x_{i1}, \ldots, x_{ik}))^{1-y_i}$).
- $\frac{\hat\beta_j - \beta_j}{se(\hat\beta_j)} \approx N(0,1)$ for large $n \geq 30$, this helps determine whether or not the real $\beta_j = 0$?
- Classification of a new object $Y(x_1, \ldots, x_k)$ as 1 or 0 according

$$Y(x_1, \ldots, x_k) = \begin{cases} 1, & \text{if } \hat p(x_1, \ldots, x_k) \geq 0.5, \\ 0, & \text{if } \hat p(x_1, \ldots, x_k) < 0.5, \end{cases}$$

where the estimated logit function $\hat p(x_1, \ldots, x_k)$ is

$$\hat p(x_1, \ldots, x_k) = \frac{e^{\hat\beta_0 + \hat\beta_1 x_1 + \ldots + \hat\beta_k x_k}}{1 + e^{\hat\beta_0 + \hat\beta_1 x_1 + \ldots + \hat\beta_k x_k}}.$$

9. Tables

(9.1) Table for $N(0,1)$ standard normal random variable $\Phi(x) = P(N(0,1) \leq x), \ x \geq 0$.
There is an important relation $\Phi(-x) = 1 - \Phi(x), \ x \geq 0$.

(9.4) Table for Binomial random variable $P(Bin(n,p) \leq k)$ if $p \leq 0.5$.
If $p > 0.5$, then $P(Bin(n,p) \leq k) = P(Bin(n,1-p) \geq n-k)$.

Table for Binomial random variable $P(Bin(n,p) \le k)$ if $p \le 0.5$.
If $p > 0.5$, then $P(Bin(n,p) \le k) = P(Bin(n, 1-p) \ge n-k)$.
