TAMS11: Probability and Statistics | Provkod: TENB | 27 March 2025, 08:00-12:00

Examiner: Xiangfeng Yang (Tel: 013 28 57 88). **Things allowed (Hjälpmedel)**: a calculator.
Scores rating (Betygsgränser): 8-11 points giving rate 3; 11.5-14.5 points giving rate 4; 15-18 points giving rate 5.
Write down all necessary steps in solutions in order to receive as many points as possible.

1 (3 points)

A factory produces plenty of small calculators. Among all defective calculators, 20% have only hardware errors, 70% have only software errors, and 10% have both hardware and software errors.
(1.1) (1p) Find the probability that a randomly selected defective calculator has hardware errors.
(1.2) (1p) Find the probability that a randomly selected defective calculator has at least one of hardware and software errors.
(1.3) (1p) Given that a randomly selected defective calculator has hardware errors, find the probability that the defective calculator has also software errors.

Solution. (1.1) Let

$$H = \{\text{a randomly selected defective calculator has hardware errors}\}$$
$$S = \{\text{a randomly selected defective calculator has software errors}\}$$

It is from the conditions that

$$P(H) = 20\% + 10\% = 30\%, \quad P(S) = 70\% + 10\% = 80\%, \quad P(H \cap S) = 10\%.$$

(1.2)

$$P(\text{a randomly selected defective calculator has at least one})$$
$$= P(H \cup S) = P(H) + P(S) - P(H \cap S) = 30\% + 80\% - 10\% = 100\%.$$

(1.3)

$$P(S \mid H) = \frac{P(S \cap H)}{P(H)} = \frac{10\%}{30\%} = \frac{1}{3} = 0.333.$$

2 (3 points)

Let (X, Y) be a two dimensional discrete random variable with the following joint probability mass function

$X \backslash Y$	5	10	15
1	0.10	0.20	0.18
2	0.15	0.05	0.32

The table tells that X takes values 1 and 2, and Y takes values 5, 10 and 15.
(2.1) (1p) Find the probability $P(X + Y \geq 8)$.
(2.2) (1p) Find the mean $E(X)$ of X, and the variance $V(Y)$ of Y.
(2.3) (1p) Are X and Y independent? Why?

Solution. (2.1)

$$P(X + Y \geq 8) = p(1, 10) + p(1, 15) + p(2, 10) + p(2, 15) = 0.20 + 0.18 + 0.05 + 0.32 = 0.75.$$

(2.2) Marginal pmfs can be found as follows

X	1	2
$p_X(x)$	0.48	0.52

Y	5	10	15
$p_Y(y)$	0.25	0.25	0.50

Therefore,

$$
\begin{aligned}
E(X) &= \sum_x x \cdot p_X(x) = 1 \cdot 0.48 + 2 \cdot 0.52 = 1.52. \\
V(Y) &= E(Y^2) - (E(Y))^2 = \sum_y y^2 \cdot p_Y(y) - (\sum_y y \cdot p_Y(y))^2 \\
&= (5^2 \cdot 0.25 + 10^2 \cdot 0.25 + 15^2 \cdot 0.5) - (5 \cdot 0.25 + 10 \cdot 0.25 + 15 \cdot 0.5)^2 \\
&= 143.75 - 11.25^2 = 143.75 - 126.5625 = 17.1875.
\end{aligned}
$$

(2.3) X and Y are NOT independent, since $p(x, y) \neq p_X(x) \cdot p_Y(y)$. For example,

$$0.10 = p(1, 5) \neq p_X(1) \cdot p_Y(5) = 0.48 \cdot 0.25 = 0.12.$$

□

3 (3 points)

A battery manufacturer claims that the distribution X of lifetimes of a certain type of batteries has a mean 40 hours and a standard deviation 5 hours. Find the probability that the average lifetime of 100 randomly selected such batteries is less than 39.5 hours.

Solution. Let $X_i, 1 \leq i \leq 100$ denote the lifetimes. According to the conditions, $\mu = E(X_i) = 40$ and $\sigma^2 = V(X_i) = 5^2$.

$$
\begin{aligned}
&P(\text{average lifetime is less than 39.5 hours}) \\
&= P(\frac{X_1 + X_2 + \ldots + X_{100}}{n} < 39.5) = P(\bar{X} < 39.5) \\
&= P(\frac{\bar{X} - \mu}{\sigma/\sqrt{n}} < \frac{39.5 - 40}{5/\sqrt{100}}) = P(N(0,1) < -1) = \Phi(-1) = 1 - \Phi(1) = 1 - 0.8413 = 0.1587.
\end{aligned}
$$

□

4 (3 points)

(4.1) (1p) A coin has two sides ("Head" denoted as 1 and "Tail" denoted as 0). Let X be the distribution of the two sides, and assume that $P(X = 1) = p$ and $P(X = 0) = 1 - p$. To determine whether or not the coin is fair, one tosses the coin 10 times with the following results:

$$\{1, \quad 1, \quad 0, \quad 1, \quad 0, \quad 0, \quad 0, \quad 1, \quad 1, \quad 0\}$$

Find a point estimate $\hat{p}_{MM}$ of p based on the method of moments.
(4.2) (2p) Let Y denote the distribution of weights of a certain type of apples from Sweden and assume that Y is normal $Y \sim N(100, \sigma^2)$. To estimate σ, a sample $\{y_1, y_2, \ldots, y_n\}$ is taken from Y. Find a point estimate $\hat{\sigma}_{ML}$ of σ based on the maximum-likelihood method.

Solution. (4.1) We can easily compute the sample mean $\bar{x} = \frac{1+1+0+1+0+0+0+1+1+0}{10} = 0.5$. The first equation of MM is $E(X) = \bar{x}$, where the population mean $E(X)$ can be computed as

$$E(X) = 1 \cdot p + 0 \cdot (1 - p) = p.$$

Therefore $E(X) = \bar{x}$ directly gives $\hat{p}_{MM} = \bar{x} = 0.5$.
(4.2) The likelihood function is

$$
\begin{aligned}
L(\sigma) = f(y_1) \cdot f(y_2) \cdot \ldots \cdot f(y_n) &= \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{(y_1 - 100)^2}{2\sigma^2}} \cdot \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{(y_2 - 100)^2}{2\sigma^2}} \cdot \ldots \cdot \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{(y_n - 100)^2}{2\sigma^2}} \\
&= \sigma^{-n} \cdot (\sqrt{2\pi})^{-n} \cdot e^{-\frac{1}{2\sigma^2}\sum_{i=1}^n (y_i - 100)^2}.
\end{aligned}
$$

Then the logarithmic likelihood function is

$$\ln L(\sigma) = -n \ln \sigma - n \ln \sqrt{2\pi} - \frac{1}{2\sigma^2} \sum_{i=1}^n (y_i - 100)^2.$$

Now taking derivative and setting it as zero give

$$0 = \ln' L(\sigma) = -\frac{n}{\sigma} + \frac{1}{\sigma^3}\sum_{i=1}^{n}(y_i - 100)^2 \Longrightarrow \hat{\sigma}^2_{ML} = \frac{1}{n}\sum_{i=1}^{n}(y_i - 100)^2 \Longrightarrow \hat{\sigma}_{ML} = \sqrt{\frac{1}{n}\sum_{i=1}^{n}(y_i - 100)^2}.$$

□

5 (3 points)

A study in Sweden is conducted to investigate if there is a difference between girls and boys at age ten in terms of heights. To this end, 46 girls at age ten are randomly chosen with an average height 145cm and a standard deviation 4.2cm; 56 boys at age ten are randomly chosen as well with an average height 141cm and a standard deviation 3.8cm. Assume that girls and boys are independent. Let μ_g and μ_b denote the average heights of all girls and all boys at age ten in Sweden respectively.
(5.1) (1.5p) Do the above samples provide any evidence that $\mu_g > \mu_b$? Answer this using an appropriate one-sided 97.5% confidence interval.
(5.2) (1.5p) Do the above samples provide any evidence that $\mu_g > \mu_b$? Answer this using appropriate hypotheses testing with a significance level $\alpha = 2.5\%$.

Solution. (5.1) This is Case 1.2', and we should construct a confidence interval in the following form

$$\begin{aligned} I_{\mu_g - \mu_b} &= (a, \quad +\infty) \\ &= \left((\bar{x}_g - \bar{x}_b) - z_\alpha\sqrt{\frac{s_g^2}{n_g} + \frac{s_b^2}{n_b}}, \quad +\infty\right) \\ &= \left((145 - 141) - z_{0.025}\sqrt{\frac{4.2^2}{46} + \frac{3.8^2}{56}}, \quad +\infty\right) \\ &= (4 - 1.96 \cdot 0.8008, \quad +\infty) = (2.4304, \quad +\infty). \end{aligned}$$

Since $2.4304 > 0$, it follows that $\mu_g - \mu_b > 0$ (namely, $\mu_g > \mu_b$).
(5.2).

$$\begin{cases} H_0: & \mu_g = \mu_b \\ H_a: & \mu_g > \mu_b \end{cases}$$

$$TS = \frac{(\bar{x}_g - \bar{x}_b) - 0}{\sqrt{\frac{s_g^2}{n_g} + \frac{s_b^2}{n_b}}} = \frac{(145 - 141) - 0}{\sqrt{\frac{4.2^2}{46} + \frac{3.8^2}{56}}} = \frac{4}{0.8008} = 4.995.$$

The rejection region is

$$C = (z_\alpha, \quad +\infty) = (z_{0.025}, \quad +\infty) = (1.96, \quad +\infty).$$

Since $TS \in C$, we reject H_0 (namely, H_a is correct: $\mu_g > \mu_b$). □

6 (3 points)

Let X denote the distribution of numbers of daily car accidents on the high way E4 between Linköping and Norrköping. One suspects that X is a Binomial random variable $X \sim Bin(2, 0.25)$. To check this, a sample with 100 observations is taken from X and they are classified into three groups as follows

values	0	1	2
frequencies	55	25	20

Based on this sample, is there any evidence showing that the population $X \sim Bin(2, 0.25)$ with a significance level $\alpha = 1\%$? (Hint: χ^2-test).

Solution. If one applies the χ^2-test here, then one can write down the hypotheses as follows

$$\begin{cases} H_0: & X \sim Bin(2, 0.25) \\ H_a: & X \nsim Bin(2, 0.25) \end{cases}$$

Therefore,

$$TS = \sum_{i=1}^{3} \frac{(n_i - np_i)^2}{np_i} = \frac{(55 - 100 \cdot 0.5625)^2}{100 \cdot 0.5625} + \frac{(25 - 100 \cdot 0.3750)^2}{100 \cdot 0.3750} + \frac{(20 - 100 \cdot 0.0625)^2}{100 \cdot 0.0625} = 34.4445.$$

where $p_1 = P(Bin(2, 0.25) = 0) = 0.5625, p_2 = P(Bin(2, 0.25) = 1) = 0.3750$ and $p_3 = P(Bin(2, 0.25) = 2) = 0.0625$. The rejection region is

$$C = (\chi^2_{0.01}(3 - 1),\ \infty) = (9.21,\ \infty).$$

It is clear that $TS \in C$, so H_0 is rejected, which suggests that there is evidence showing that $X \nsim Bin(2, 0.25)$.

$\square$

TAMS11: formulas and tables — by Xiangfeng Yang

1. Basic probability

(1.1) Conditional probability $P(A|B) = \frac{P(A\cap B)}{P(B)}$.
(1.2) Total probability $P(B) = \sum_{i=1}^k P(B|A_i)P(A_i)$ where $\{A_i\}$ are disjoint and $\cup_{i=1}^k A_i = S$.
(1.3) Bayes' Theorem $P(A_j|B) = \frac{P(B|A_j)P(A_j)}{\sum_{i=1}^k P(B|A_i)P(A_i)}$ where $\{A_i\}$ are in (1.2).

2. Random variables (r.v.s)

(2.1) Discrete r.v. X has a pmf $p(x) = P(X = x)$ satisfying $p(x) \geq 0$ and $\sum p(x_i) = 1$,

X	x_1	x_2	$\cdots$	x_n	$\cdots$
$p(x)$	$p(x_1)$	$p(x_2)$	$\cdots$	$p(x_n)$	$\cdots$

Expectation (or *Expected value* or *mean*) $\mu_X = E(X) = \sum x_i p(x_i)$;
Variance $\sigma_X^2 = V(X) = E(X-\mu_X)^2 = E(X^2) - \mu_X^2 = \sum x_i^2 p(x_i) - (\sum x_i p(x_i))^2$.
(2.2) Continuous r.v. X has a pdf $f(x)$ satisfying $f(x) \geq 0$ and $\int_{-\infty}^{\infty} f(x)dx = 1$,

$$P(a < X < b) = \int_a^b f(x)dx.$$

Expectation (or *Expected value* or *mean*) $\mu_X = E(X) = \int_{-\infty}^{\infty} xf(x)dx$;
Variance $\sigma_X^2 = V(X) = E(X-\mu_X)^2 = E(X^2) - \mu_X^2 = \int_{-\infty}^{\infty} x^2 f(x)dx - \left(\int_{-\infty}^{\infty} xf(x)dx\right)^2$.
(2.3) Cumulative distribution function (cdf) of a r.v. X is $F(x) = P(X \leq x)$.
(2.4) X and Y are r.v.s, a, b and c are scalars, then

$$E(aX + bY + c) = aE(X) + bE(Y) + c,$$
$$V(aX + bY + c) = a^2V(X) + b^2V(Y) + 2ab\ cov(X,Y),$$
$$E(g(X,Y)) = \begin{cases} \sum_{i,j} g(x_i,y_j)\cdot p(x_i,y_j), & \text{for discrete } (X,Y), \\ \int_{-\infty}^{\infty}\int_{-\infty}^{\infty} g(x,y)\cdot f(x,y)dxdy, & \text{for continuous } (X,Y). \end{cases}$$

(2.5) • Discrete r.v. (X,Y) has a joint pmf $p(x,y)$ satisfying $p(x,y) \geq 0$ and $\sum_{x_i}\sum_{y_i} p(x_i,y_i) = 1$.
The *marginal pmf* of X is $p_X(x) = \sum_y p(x,y)$;
The *marginal pmf* of Y is $p_Y(y) = \sum_x p(x,y)$;
X and Y are *independent* if $p(x,y) = p_X(x)\cdot p_Y(y)$.
• Continuous r.v. (X,Y) has a joint pdf $p(x,y)$ satisfying $f(x,y) \geq 0$ and $\int_{-\infty}^{\infty}\int_{-\infty}^{\infty} f(x,y)dxdy = 1$.
The *marginal pdf* of X is $f_X(x) = \int_{-\infty}^{\infty} f(x,y)dy$;
The *marginal pdf* of Y is $f_Y(y) = \int_{-\infty}^{\infty} f(x,y)dx$;
X and Y are *independent* if $f(x,y) = f_X(x)\cdot f_Y(y)$.

3. Several special r.v.s

(3.1) $X \sim Bin(n,p)$ has a pmf $p(x) = P(X=x) = \binom{n}{x}\cdot p^x\cdot(1-p)^{n-x}, \quad x = 0,1,2,\ldots,n.$
$E(X) = n\cdot p, \quad V(X) = n\cdot p\cdot(1-p).$
(3.2) $X \sim Po(\lambda)$ has a pmf $p(x) = P(X=x) = \frac{e^{-\lambda}\lambda^x}{x!}, \quad x = 0,1,2,\ldots.$
$E(X) = \lambda, \quad V(X) = \lambda.$
(3.3) $X \sim Hypergeometric$ has a pmf $p(x) = P(X=x) = \frac{\binom{M}{x}\binom{N-M}{n-x}}{\binom{N}{n}}$.
(3.4) $X \sim Exp(\lambda)$ has a pdf

$$f(x) = \begin{cases} \lambda e^{-\lambda x}, & x \geq 0, \\ 0, & \text{otherwise.} \end{cases}$$

$E(X) = \frac{1}{\lambda}, \quad V(X) = \left(\frac{1}{\lambda}\right)^2.$
(3.5) $X \sim N(\mu,\sigma^2)$ has a pdf

$$f(x) = \frac{1}{\sigma\sqrt{2\pi}}e^{-\frac{(x-\mu)^2}{2\sigma^2}}, -\infty < x < \infty.$$

$E(X) = \mu, \quad V(X) = \sigma^2.$
(3.6) $X \sim U(a,b)$ has a pdf

$$f(x) = \begin{cases} \frac{1}{b-a}, & a < x < b, \\ 0, & \text{otherwise.} \end{cases}$$

$E(X) = \frac{a+b}{2}, \quad V(X) = \frac{(b-a)^2}{12}.$

4. Central Limit Theorem (CLT)

Suppose that a population has mean= μ and variance= σ^2. A random sample $\{X_1, X_2, \ldots, X_n\}$ from this population is given. Then for large $n \geq 30$,

$$\frac{\bar{X}-\mu}{\sigma/\sqrt{n}} \sim N(0,1). \qquad (1)$$

• If the population is normal, then (1) holds for any n.
• Note that $\mu = E(\bar{X})$ and $(\sigma/\sqrt{n})^2 = V(\bar{X})$.

5. Several notations in statistics

(5.1) Sample mean: $\bar{X} = \frac{X_1+X_2+\ldots X_n}{n} = \frac{\sum X_i}{n}$; $\bar{x} = \frac{x_1+x_2+\ldots x_n}{n} = \frac{\sum x_i}{n}$.
(5.2) Sample variance:

$$S^2 = \frac{\sum(X_i-\bar{X})^2}{n-1} = \frac{1}{n-1}\left(\sum X_i^2 - \frac{(\sum X_i)^2}{n}\right); \quad s^2 = \frac{\sum(x_i-\bar{x})^2}{n-1} = \frac{1}{n-1}\left(\sum x_i^2 - \frac{(\sum x_i)^2}{n}\right).$$

• Capital letters $\bar{X}$ and S^2 refer to the objects based on random sample (therefore they are in general r.v.s), while small letters $\bar{x}$ and s^2 are the objects based on observations (so they are scalars).
(5.3) A point estimator of θ obtained by Methods of Moments is denoted as $\hat{\theta}_{MM}$.
(5.4) A point estimator of θ obtained by Maximum Likelihood method is denoted as $\hat{\theta}_{ML}$.

6. Confidence Interval (CI)

In this course, three types of confidence intervals are studied depending on the unknown population parameter(s): CI-1 (confidence intervals for population mean(s)), CI-2 (confidence intervals for population variance(s)), and CI-3 (confidence intervals for population propotion(s)).

CI-1: $(1-\alpha)$ CI of a population mean μ

$\boxed{\text{case 1.1 (any } n)}$ If population $X \sim N(\mu, \sigma^2)$ and σ^2 is known, then $\frac{\bar{X}-\mu}{\sigma/\sqrt{n}} \sim N(0,1)$ and

$$I_\mu = \left(\bar{x} - z_{\alpha/2}\cdot\frac{\sigma}{\sqrt{n}}, \bar{x} + z_{\alpha/2}\cdot\frac{\sigma}{\sqrt{n}}\right) := \bar{x} \mp z_{\alpha/2}\cdot\frac{\sigma}{\sqrt{n}}.$$

$\boxed{\text{case 1.2 } (n \geq 30)}$ For any population X, it holds that $\frac{\bar{X}-\mu}{\sigma/\sqrt{n}} \sim N(0,1)$ and

$$I_\mu = \bar{x} \mp z_{\alpha/2}\cdot\frac{\sigma}{\sqrt{n}} \text{ or } I_\mu = \bar{x} \mp z_{\alpha/2}\cdot\frac{\hat{\sigma}}{\sqrt{n}}.$$

$\boxed{\text{case 1.3 (any } n)}$ If population $X \sim N(\mu, \sigma^2)$ and σ^2 is unknown, then $\frac{\bar{X}-\mu}{S/\sqrt{n}} \sim T(n-1)$ and

$$I_\mu = \bar{x} \mp t_{\alpha/2}(n-1)\cdot\frac{s}{\sqrt{n}}.$$

CI-1′: $(1-\alpha)$ CI of the difference of two population means $\mu_X - \mu_Y$

$\boxed{\text{case 1.1}' \text{ (any } n_1, n_2)}$ If independent populations $X \sim N(\mu_X, \sigma_X^2), Y \sim N(\mu_Y, \sigma_Y^2)$, and σ_X^2, σ_Y^2 are known, then $\frac{(\bar{X}-\bar{Y})-(\mu_X-\mu_Y)}{\sqrt{\frac{\sigma_X^2}{n_1}+\frac{\sigma_Y^2}{n_2}}} \sim N(0,1)$, and $I_{\mu_X-\mu_Y} = (\bar{x}-\bar{y}) \mp z_{\alpha/2}\cdot\sqrt{\frac{\sigma_X^2}{n_1}+\frac{\sigma_Y^2}{n_2}}$.

$\boxed{\text{case 1.2}' \text{ } (n_1, n_2 \geq 30)}$ For any independent populations X and Y, it holds that

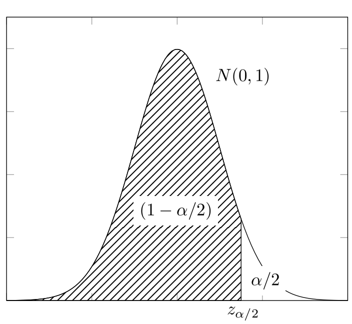
$$\frac{(\bar{X}-\bar{Y})-(\mu_X-\mu_Y)}{\sqrt{\frac{\sigma_X^2}{n_1}+\frac{\sigma_Y^2}{n_2}}} \sim N(0,1) \text{ and}$$

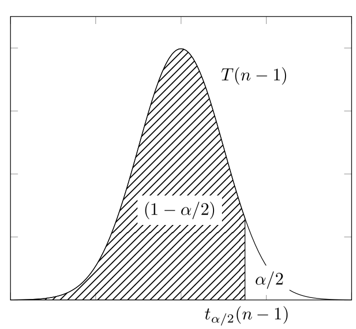
$$I_{\mu_X-\mu_Y} = (\bar{x}-\bar{y}) \mp z_{\alpha/2}\cdot\sqrt{\frac{\sigma_X^2}{n_1}+\frac{\sigma_Y^2}{n_2}} \text{ or } I_{\mu_X-\mu_Y} = (\bar{x}-\bar{y}) \mp z_{\alpha/2}\cdot\sqrt{\frac{\hat{\sigma}_X^2}{n_1}+\frac{\hat{\sigma}_Y^2}{n_2}}.$$

$\boxed{\text{case 1.3}' \text{ (any } n_1, n_2)}$ If independent populations $X \sim N(\mu_X, \sigma_X^2), Y \sim N(\mu_Y, \sigma_Y^2)$, where σ_X^2, σ_Y^2 are unknown but $\sigma_X^2 = \sigma_Y^2$, then

$$\frac{(\bar{X}-\bar{Y})-(\mu_X-\mu_Y)}{S\sqrt{\frac{1}{n_1}+\frac{1}{n_2}}} \sim T(n_1+n_2-2), \text{ where } S^2 = \frac{(n_1-1)S_X^2+(n_2-1)S_Y^2}{n_1+n_2-2}, \text{ and}$$

$$I_{\mu_X-\mu_Y} = (\bar{x}-\bar{y}) \mp t_{\alpha/2}(n_1+n_2-2)\cdot s\sqrt{\frac{1}{n_1}+\frac{1}{n_2}}.$$





CI-2: $(1-\alpha)$ CI of population variance(s) σ^2

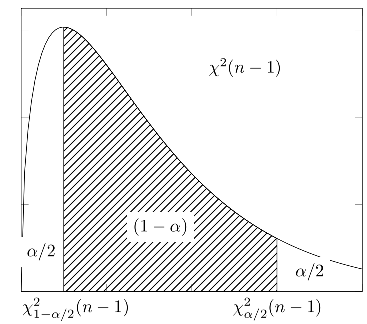
• If a population $X \sim N(\mu, \sigma^2)$ and σ^2 is unknown, then $\frac{(n-1)S^2}{\sigma^2} \sim \chi^2(n-1)$, and

$$I_{\sigma^2} = \left(\frac{(n-1)s^2}{\chi^2_{\alpha/2}(n-1)}, \quad \frac{(n-1)s^2}{\chi^2_{1-\alpha/2}(n-1)}\right).$$

• If two independent populations $X \sim N(\mu_X, \sigma^2)$ and $Y \sim N(\mu_Y, \sigma^2)$, and σ^2 is unknown, then $\frac{(n_1+n_2-2)S^2}{\sigma^2} \sim \chi^2(n_1+n_2-2)$, and

$$I_{\sigma^2} = \left(\frac{(n_1+n_2-2)s^2}{\chi^2_{\alpha/2}(n_1+n_2-2)}, \quad \frac{(n_1+n_2-2)s^2}{\chi^2_{1-\alpha/2}(n_1+n_2-2)}\right),$$

where $S^2 = \frac{(n_1-1)S_X^2+(n_2-1)S_Y^2}{n_1+n_2-2}$.



CI-3: $(1-\alpha)$ CI of population proportion(s)

• If a (large) population has an unknow proportion p, then $\frac{\hat{P}-p}{\sqrt{p(1-p)/n}} \sim N(0,1)$ if $n\hat{p} \geq 10$ and $n(1-\hat{p}) \geq 10$ with $\hat{p} = x/n$, and $I_p = \hat{p} \mp z_{\alpha/2}\cdot\sqrt{\frac{\hat{p}(1-\hat{p})}{n}}$.

• If two independent (large) populations have unknow proportions p_1 and p_2, then

$$\frac{(\hat{P}_1-\hat{P}_2)-(p_1-p_2)}{\sqrt{\frac{p_1(1-p_1)}{n_1}+\frac{p_2(1-p_2)}{n_2}}} \sim N(0,1)$$

if $n_i\hat{p}_i \geq 10$ and $n_i(1-\hat{p}_i) \geq 10$ for $i = 1, 2$, and $I_{p_1-p_2} = (\hat{p}_1-\hat{p}_2) \mp z_{\alpha/2}\cdot\sqrt{\frac{\hat{p}_1(1-\hat{p}_1)}{n_1}+\frac{\hat{p}_2(1-\hat{p}_2)}{n_2}}$.

7. Hypothesis Test (HT)

	H_0 is true	H_0 is false and $\theta = \theta_1$
reject H_0	(type I error or significance level) α	(power) $h(\theta_1)$
don't reject H_0	$1-\alpha$	(type II error) $\beta(\theta_1) = 1 - h(\theta_1)$

$$\text{reject } H_0 \Leftrightarrow TS \in C \Leftrightarrow p\text{-value} < \alpha$$

χ^2 tests for populations (non-parametric tests)

Suppose that for a random sample of a population X, the n elements of it are classified into k disjoint groups $A_i, 1 \leq i \leq k$. For each group $A_i, 1 \leq i \leq k$, suppose that there are $N_i, 1 \leq i \leq k$ elements inside. Let $p_i = P(A_i)$ assuming a given distribution of X. Note that $p_1 + p_2 + \ldots + p_k = 1$ and $N_1 + N_2 + \ldots + N_k = n$. One wants to test the hypotheses

$$H_0 : P(A_i) = p_i, \ 1 \leq i \leq k, \quad H_a : P(A_i) \neq p_i \text{ for some } 1 \leq i \leq k.$$

If n is large in the sense that $np_i \geq 5$ for all $1 \leq i \leq k$, then the test statistic is

$$\sum_{i=1}^{k} \frac{(N_i - np_i)^2}{np_i} \approx \chi^2(k-1).$$

Therefore the observation of the test statistic is

$$TS = \sum_{i=1}^{k} \frac{(n_i - np_i)^2}{np_i}, \text{ where } n_i \text{ is the observation of } N_i, 1 \leq i \leq k.$$

For the critical region C, one can take (note that if H_0 is true, then TS should be close to zero)

$$C = (\chi^2_\alpha(k-1),\ \infty).$$

The conclusion would be $TS \in C \Longleftrightarrow H_0$ is rejected.

8. Linear and logistic regression

(Multiple) linear regression: $Y = \beta_0 + \beta_1 x_1 + \ldots + \beta_k x_k + \varepsilon, \quad \varepsilon \sim N(0, \sigma^2)$.

- Y : response variable (which is normal r.v.), $\{x_1, \ldots, x_k\}$: predictors (which are scalars).
- sample: $\{(x_{11}, \ldots, x_{1k}; y_1), (x_{21}, \ldots, x_{2k}; y_2) \ldots, (x_{n1}, \ldots, x_{nk}; y_n)\}$.
- how to estimate $\beta_j \approx \hat{\beta}_j$: least square method, that is, to minimize $\sum_{i=1}^{n} (\hat{y}_i - y_i)^2$, where the estimated (multiple) linear regression line $\hat{y}$ is

$$\hat{y} = \hat{\beta}_0 + \hat{\beta}_1 x_1 + \ldots + \hat{\beta}_k x_k.$$

- $\frac{\hat{\beta}_j - \beta_j}{se(\hat{\beta}_j)} \sim T(n-k-1)$, this helps determine whether or not the real $\beta_j = 0$?
- $\sigma^2 \approx \frac{SS_E}{n-k-1}$, this gives an estimation of the size of the error.
- $R^2 = \frac{SS_R}{SS_T}$, this gives how well the model is (if $R^2 \approx 1$, then the model fits the sample very well).
- How to test $\beta_1 = \ldots = \beta_k = 0$? Use the random variable $\frac{SS_R/k}{SS_E/(n-k-1)} \sim F(k, n-k-1)$.

Logistic regression: Let Y can only take 0 or 1 with $P(Y=1) = p$ and $P(Y=0) = 1-p$,

$$E(Y) = p(x_1, \ldots, x_k) = \frac{e^{\beta_0 + \beta_1 x_1 + \ldots + \beta_k x_k}}{1 + e^{\beta_0 + \beta_1 x_1 + \ldots + \beta_k x_k}}.$$

- Y : response variable (which is Bernoulli r.v. $P(Y=1) = p$ and $P(Y=0) = 1-p$, so $E(Y) = p$), $\{x_1, \ldots, x_k\}$: predictors (which are scalars).
- sample: $\{(x_{11}, \ldots, x_{1k}; y_1), (x_{21}, \ldots, x_{2k}; y_2) \ldots, (x_{n1}, \ldots, x_{nk}; y_n)\}$.
- how to estimate $\beta_j \approx \hat{\beta}_j$: maximal likelihood method (maximize $\prod_{i=1}^{n} p(x_{i1}, \ldots, x_{ik})^{y_i} (1 - p(x_{i1}, \ldots, x_{ik}))^{1-y_i}$).
- $\frac{\hat{\beta}_j - \beta_j}{se(\hat{\beta}_j)} \approx N(0,1)$ for large $n \geq 30$, this helps determine whether or not the real $\beta_j = 0$?
- Classification of a new object $Y(x_1, \ldots, x_k)$ as 1 or 0 according

$$Y(x_1, \ldots, x_k) = \begin{cases} 1, & \text{if } \hat{p}(x_1, \ldots, x_k) \geq 0.5, \\ 0, & \text{if } \hat{p}(x_1, \ldots, x_k) < 0.5, \end{cases}$$

where the estimated logit function $\hat{p}(x_1, \ldots, x_k)$ is

$$\hat{p}(x_1, \ldots, x_k) = \frac{e^{\hat{\beta}_0 + \hat{\beta}_1 x_1 + \ldots + \hat{\beta}_k x_k}}{1 + e^{\hat{\beta}_0 + \hat{\beta}_1 x_1 + \ldots + \hat{\beta}_k x_k}}.$$

9. Tables

(9.1) Table for $N(0,1)$ standard normal random variable $\Phi(x) = P(N(0,1) \le x),\ \ x \ge 0$.
There is an important relation $\Phi(-x) = 1 - \Phi(x),\ \ x \ge 0$.
