1 (3 points)

In a box, there are 12 white balls and 8 black balls. One randomly takes out 6 balls one by one, and observes the colors.
(1.1) (1p) If this is done without replacement (namely, once a ball is taken out and observed, it will be put outside of the box), then what is the probability that exactly 2 black balls are observed?
(1.2) (2p) If this is done with replacement (namely, after a ball is taken out and observed, it will be put back into the box), then what is the probability that exactly 2 black balls are observed?

Solution. (1.1) This is exactly hypergeometric random variable, namely,

$$P(\text{exactly 2 black}) = \frac{\binom{8}{2} \cdot \binom{12}{4}}{\binom{20}{6}} = 0.3576.$$

(1.2) Let X be the number of black balls in these 6 chosen balls, then $X \sim Bin(6, 8/(12+8)) = Bin(6, 0.4)$.

$$P(\text{exactly 2 black}) = P(X = 2) = P(X \le 2) - P(X \le 1) = (\text{Binomial table}) = 0.5443 - 0.2333 = 0.311.$$

The distribution X of the numbers of cars of all households in Linköping is as follows

X	0	1	2	3
$p(x)$	20%	50%	25%	5%

The above tables says that each randomly chosen household in Linköping may have 0, 1, 2 or 3 cars with the corresponding probabilities. Now one randomly chooses 200 households in Linköping, what is the probability that the average number of cars of these 200 households is less than or equal to 1?

Solution. Let X_i denote the number of cars of the i-th household for $i = 1, 2, \ldots, 200$, then we want to find the probability $P(\bar{X} \le 1)$ where $\bar{X} = \frac{X_1+X_2+\ldots+X_{200}}{200}$. To achieve this, one needs to find individual (population) mean μ and variance σ^2 as follows (as a discrete random variable give by the above table)

$$\mu = 0\cdot 20\% + 1\cdot 50\% + 2\cdot 25\% + 3\cdot 5\% = 1.15, \quad \sigma^2 = [0^2\cdot 20\% + 1^2\cdot 50\% + 2^2\cdot 25\% + 3^2\cdot 5\%] - 1.15^2 = 1.95 - 1.3225 = 0.6275.$$

Then it is from CLT that

$$P(\bar{X} \le 1) = P\left(\frac{\bar{X}-\mu}{\sigma/\sqrt{n}} \le \frac{1-\mu}{\sigma/\sqrt{n}}\right) = P\left(N(0,1) \le \frac{1-1.15}{\sqrt{0.6275}/\sqrt{200}}\right) = P\left(N(0,1) \le -2.68\right)$$
$$= \Phi(-2.68) = 1 - \Phi(2.68) = 1 - 0.9963 = 0.0037.$$

Two fair dice are tossed one by one independently. Let X_1 be the upper side number of the first die, X_2 be the upper side number of the second die and X_3 be the sum of the upper side numbers of the two dice.
(3.1) (1p) Are the two events $\{X_1 = 4\}$ and $\{X_3 = 6\}$ independent? Why?
(3.2) (1p) Are the two events $\{X_1 = 4\}$ and $\{X_3 = 7\}$ independent? Why?
(3.3) (1p) Find the conditional probability $P(X_3 = 5 \mid X_2 = 2)$.

Solution. (3.1) Not independent! It is from the fact that X_1 and X_2 are independent (since two dice are independent)

$$P(X_1 = 4, X_3 = 6) = P(X_1 = 4, X_2 = 2) = P(X_1 = 4) \cdot P(X_2 = 2) = \frac{1}{6} \cdot \frac{1}{6} = \frac{1}{36},$$
$$P(X_1 = 4) = \frac{1}{6},$$
$$P(X_3 = 6) = P((1,5),(5,1),(2,4),(4,2),(3,3)) = \frac{5}{36}.$$

It is clear that $P(X_1 = 4, X_3 = 6) \neq P(X_1 = 4) \cdot P(X_3 = 6)$.
(3.2) Independent!

$$P(X_1 = 4, X_3 = 7) = P(X_1 = 4, X_2 = 3) = P(X_1 = 4) \cdot P(X_2 = 3) = \frac{1}{6} \cdot \frac{1}{6} = \frac{1}{36},$$
$$P(X_1 = 4) = \frac{1}{6},$$
$$P(X_3 = 7) = P((1,6),(6,1),(2,5),(5,2),(3,4),(4,3)) = \frac{6}{36} = \frac{1}{6}.$$

It is clear that $P(X_1 = 4, X_3 = 7) = P(X_1 = 4) \cdot P(X_3 = 7)$.
(3.3)

$$P(X_3 = 5 \mid X_2 = 2) = \frac{P(X_3 = 5, X_2 = 2)}{P(X_2 = 2)} = \frac{P(X_1 = 3, X_2 = 2)}{P(X_2 = 2)} = \frac{P(X_1 = 3) \cdot P(X_2 = 2)}{P(X_2 = 2)} = P(X_1 = 3) = \frac{1}{6}.$$

□

4 (3 points)

A population $X \sim Bin(3, p)$ is a Binomial random variable with an unknown parameter p. A sample $\{2, 1, 1, 0\}$ is taken from this population.
(4.1) (1p) Use the Method of Moments to find a point estimate $\hat{p}_{MM}$ of p.
(4.2) (2p) Use the Maximum Likelihood Method to find a point estimate $\hat{p}_{ML}$ of p.

Solution. (4.1) It is from the method of moments that $E(X) = \bar{x}$ where $E(X) = 3 \cdot p$, which implies that

$$3 \cdot p = \bar{x} \Rightarrow \hat{p}_{MM} = \bar{x}/3 = 1/3 = 0.3333.$$

(4.2) The likelihood function is

$$L(p) = p(x_1) \cdot \ldots \cdot p(x_4) = \left[\binom{3}{x_1} p^{x_1} \cdot (1-p)^{3-x_1}\right] \cdot \ldots \cdot \left[\binom{3}{x_4} p^{x_4} \cdot (1-p)^{3-x_4}\right]$$
$$= \left[\binom{3}{x_1} \cdots \binom{3}{x_4}\right] \cdot p^{x_1 + \ldots + x_4} \cdot (1-p)^{12-(x_1+\ldots+x_4)}.$$

The log likelihood function is $\ln L(p) = \ln \left[\binom{3}{x_1} \cdots \binom{3}{x_4}\right] + (x_1 + \ldots + x_4) \ln p + (12 - (x_1 + \ldots + x_4)) \ln(1-p)$.
Taking derivative yields

$$0 = \ln' L(p) = \frac{x_1 + \ldots + x_4}{p} - \frac{12 - (x_1 + \ldots + x_4)}{1-p} \Rightarrow \hat{p}_{ML} = \bar{x}/3 = 1/3 = 0.3333.$$

5 (3 points)

There are two equally popular restaurants in Linköping (marked as A and B). "Equally popular" means that the preference of each restaurant is

A	B
50%	50%

. This month the restaurant A has employed a new chef, and the aim is to increase the restaurant's preference. Now a sample of 100 people have been asked for their preference with the following results

A	B
53%	47%

. Based on the sample, has the new chef really changed the preference of the restaurants? Answer this question using a χ^2-test with a level $\alpha = 5\%$.

Solution. Here we want to test the hypothesis:

$$H_0 : P(A) = 50\%, P(B) = 50\% \text{ vs. } H_a : \text{ some is not true in } H_0$$

The observed value of the test statistic under H_0 is

$$TS = \sum_{i=1}^{2} \frac{(n_i - np_i)^2}{np_i} = \frac{(53 - 100 \cdot 50\%)^2}{100 \cdot 50\%} + \frac{(47 - 100 \cdot 50\%)^2}{100 \cdot 50\%} = \frac{18}{50} = 0.36.$$

The rejection region is

$$C = (\chi^2_\alpha(k-1), \infty) = (\chi^2_{0.05}(1), \infty) = (3.84, \infty).$$

As $TS \notin C$, H_0 is not rejected (the sample does not provide any evidence that the new chef has really changed the preference). □

6 (3 points)

A professor at LiU claims that the heights of students at LiU differ a lot. To conduct a statistical study on this, let us assume that the distribution X of the heights of students at LiU is normal $X \sim N(\mu, \sigma^2)$ (with μ denoting the average height and σ^2 the variation of the heights). A sample is taken from X with sample size $n = 20$, sample mean $\bar{x} = 178$ and sample variance $s^2 = 15.6$. Does the sample provide any evidence that $\sigma^2 > 10$ with a confidence 95%? Answer this question by using an appropriate one-sided 95% confidence interval (Do NOT use hypothesis test).

Solution. Because here we want to check whether or not $\sigma^2 > 10$, an one-sided 95% confidence interval $I_{\sigma^2} = (a, \ \infty)$ should be constructed (and then one needs to compare a with 10). To this end, one-sided 95% confidence interval is

$$I_{\sigma^2} = \left(\frac{(n-1)s^2}{\chi^2_\alpha(n-1)}, \ \infty \right) = \left(\frac{(20-1)15.6}{\chi^2_{0.05}(20-1)}, \ \infty \right) = \left(\frac{296.4}{30.14}, \ \infty \right) = (9.834, \ \infty).$$

As $9.834 \not> 10$, the sample does NOT provide any evidence that $\sigma^2 > 10$. □

TAMS42: formulas and tables — by Xiangfeng Yang

1. Basic probability

(1.1) Conditional probability $P(A|B) = \frac{P(A\cap B)}{P(B)}$.
(1.2) Total probability $P(B) = \sum_{i=1}^{k} P(B|A_i)P(A_i)$ where $\{A_i\}$ are disjoint and $\cup_{i=1}^{k} A_i = S$.
(1.3) Bayes' Theorem $P(A_j|B) = \frac{P(B|A_j)P(A_j)}{\sum_{i=1}^{k} P(B|A_i)P(A_i)}$ where $\{A_i\}$ are in (1.2).

2. Random variables (r.v.s)

(2.1) Discrete r.v. X has a pmf $p(x) = P(X = x)$ satisfying $p(x) \geq 0$ and $\sum p(x_i) = 1$,

X	x_1	x_2	$\cdots$	x_n	$\cdots$
$p(x)$	$p(x_1)$	$p(x_2)$	$\cdots$	$p(x_n)$	$\cdots$

Expectation (or *Expected value* or *mean*) $\mu_X = E(X) = \sum x_i p(x_i)$;
Variance $\sigma_X^2 = V(X) = E(X-\mu_X)^2 = E(X^2) - \mu_X^2 = \sum x_i^2 p(x_i) - (\sum x_i p(x_i))^2$.
(2.2) Continuous r.v. X has a pdf $f(x)$ satisfying $f(x) \geq 0$ and $\int_{-\infty}^{\infty} f(x)dx = 1$,

$$P(a < X < b) = \int_a^b f(x)dx.$$

Expectation (or *Expected value* or *mean*) $\mu_X = E(X) = \int_{-\infty}^{\infty} xf(x)dx$;
Variance $\sigma_X^2 = V(X) = E(X-\mu_X)^2 = E(X^2) - \mu_X^2 = \int_{-\infty}^{\infty} x^2 f(x)dx - \left(\int_{-\infty}^{\infty} xf(x)dx\right)^2$.
(2.3) Cumulative distribution function (cdf) of a r.v. X is $F(x) = P(X \leq x)$.
(2.4) X and Y are r.v.s, a, b and c are scalars, then

$$E(aX + bY + c) = aE(X) + bE(Y) + c,$$
$$V(aX + bY + c) = a^2V(X) + b^2V(Y) + 2ab\ cov(X, Y),$$
$$E(g(X,Y)) = \begin{cases} \sum_{i,j} g(x_i, y_j)\cdot p(x_i, y_j), & \text{for discrete } (X,Y), \\ \int_{-\infty}^{\infty}\int_{-\infty}^{\infty} g(x,y)\cdot f(x,y)dxdy, & \text{for continuous } (X,Y). \end{cases}.$$

(2.5) • Discrete r.v. (X, Y) has a joint pmf $p(x, y)$ satisfying $p(x, y) \geq 0$ and $\sum_{x_i}\sum_{y_i} p(x_i, y_i) = 1$.
The *marginal pmf* of X is $p_X(x) = \sum_y p(x, y)$;
The *marginal pmf* of Y is $p_Y(y) = \sum_x p(x, y)$;
X and Y are *independent* if $p(x, y) = p_X(x)\cdot p_Y(y)$.
• Continuous r.v. (X, Y) has a joint pdf $p(x, y)$ satisfying $f(x, y) \geq 0$ and $\int_{-\infty}^{\infty}\int_{-\infty}^{\infty} f(x, y)dxdy = 1$.
The *marginal pdf* of X is $f_X(x) = \int_{-\infty}^{\infty} f(x, y)dy$;
The *marginal pdf* of Y is $f_Y(y) = \int_{-\infty}^{\infty} f(x, y)dx$;
X and Y are *independent* if $f(x, y) = f_X(x)\cdot f_Y(y)$.

3. Several special r.v.s

(3.1) $X \sim Bin(n, p)$ has a pmf $p(x) = P(X = x) = \binom{n}{x}\cdot p^x\cdot(1-p)^{n-x}, \quad x = 0, 1, 2, \ldots, n.$
$E(X) = n\cdot p, \quad V(X) = n\cdot p\cdot(1-p)$.
(3.2) $X \sim Po(\lambda)$ has a pmf $p(x) = P(X = x) = \frac{e^{-\lambda}\lambda^x}{x!}, \quad x = 0, 1, 2, \ldots.$
$E(X) = \lambda, \quad V(X) = \lambda$.
(3.3) $X \sim Hypergeometric$ has a pmf $p(x) = P(X = x) = \frac{\binom{M}{x}\binom{N-M}{n-x}}{\binom{N}{n}}$.
(3.4) $X \sim Exp(\lambda)$ has a pdf

$$f(x) = \begin{cases} \lambda e^{-\lambda x}, & x \geq 0, \\ 0, & \text{otherwise.} \end{cases}$$

$E(X) = \frac{1}{\lambda}, \quad V(X) = \left(\frac{1}{\lambda}\right)^2$.
(3.5) $X \sim N(\mu, \sigma^2)$ has a pdf

$$f(x) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}, -\infty < x < \infty.$$

$E(X) = \mu, \quad V(X) = \sigma^2$.
(3.6) $X \sim U(a, b)$ has a pdf

$$f(x) = \begin{cases} \frac{1}{b-a}, & a < x < b, \\ 0, & \text{otherwise.} \end{cases}$$

$E(X) = \frac{a+b}{2}, \quad V(X) = \frac{(b-a)^2}{12}$.

4. Central Limit Theorem (CLT)

Suppose that a population has mean= μ and variance= σ^2. A random sample $\{X_1, X_2, \ldots, X_n\}$ from this population is given. Then for large $n \geq 30$,

$$\frac{\bar{X} - \mu}{\sigma/\sqrt{n}} \sim N(0, 1). \tag{1}$$

- If the population is normal, then (1) holds for any n.
- Note that $\mu = E(\bar{X})$ and $(\sigma/\sqrt{n})^2 = V(\bar{X})$.

5. Several notations in statistics

(5.1) Sample mean: $\bar{X} = \frac{X_1+X_2+\ldots X_n}{n} = \frac{\sum X_i}{n}$; $\bar{x} = \frac{x_1+x_2+\ldots x_n}{n} = \frac{\sum x_i}{n}$.
(5.2) Sample variance:

$$S^2 = \frac{\sum(X_i - \bar{X})^2}{n-1} = \frac{1}{n-1}\left(\sum X_i^2 - \frac{(\sum X_i)^2}{n}\right); \quad s^2 = \frac{\sum(x_i - \bar{x})^2}{n-1} = \frac{1}{n-1}\left(\sum x_i^2 - \frac{(\sum x_i)^2}{n}\right).$$

• Capital letters $\bar{X}$ and S^2 refer to the objects based on random sample (therefore they are in general r.v.s), while small letters $\bar{x}$ and s^2 are the objects based on observations (so they are scalars).
(5.3) A point estimator of θ obtained by Methods of Moments is denoted as $\hat{\theta}_{MM}$.
(5.4) A point estimator of θ obtained by Maximum Likelihood method is denoted as $\hat{\theta}_{ML}$.

6. Confidence Interval (CI)

In this course, three types of confidence intervals are studied depending on the unknown population parameter(s): CI-1 (confidence intervals for population mean(s)), CI-2 (confidence intervals for population variance(s)), and CI-3 (confidence intervals for population propotion(s)).

CI-1: $(1-\alpha)$ CI of a population mean μ

$\boxed{\text{case 1.1 (any } n)}$ If population $X \sim N(\mu, \sigma^2)$ and σ^2 is known, then $\frac{\bar{X}-\mu}{\sigma/\sqrt{n}} \sim N(0,1)$ and

$$I_\mu = \left(\bar{x} - z_{\alpha/2} \cdot \frac{\sigma}{\sqrt{n}}, \bar{x} + z_{\alpha/2} \cdot \frac{\sigma}{\sqrt{n}}\right) := \bar{x} \mp z_{\alpha/2} \cdot \frac{\sigma}{\sqrt{n}}.$$

$\boxed{\text{case 1.2 } (n \geq 30)}$ For any population X, it holds that $\frac{\bar{X}-\mu}{\sigma/\sqrt{n}} \sim N(0,1)$ and

$$I_\mu = \bar{x} \mp z_{\alpha/2} \cdot \frac{\sigma}{\sqrt{n}} \text{ or } I_\mu = \bar{x} \mp z_{\alpha/2} \cdot \frac{\hat{\sigma}}{\sqrt{n}}.$$

$\boxed{\text{case 1.3 (any } n)}$ If population $X \sim N(\mu, \sigma^2)$ and σ^2 is unknown, then $\frac{\bar{X}-\mu}{S/\sqrt{n}} \sim T(n-1)$ and

$$I_\mu = \bar{x} \mp t_{\alpha/2}(n-1) \cdot \frac{s}{\sqrt{n}}.$$

CI-1′: $(1-\alpha)$ CI of the difference of two population means $\mu_X - \mu_Y$

$\boxed{\text{case 1.1}' \text{ (any } n_1, n_2)}$ If independent populations $X \sim N(\mu_X, \sigma_X^2), Y \sim N(\mu_Y, \sigma_Y^2)$, and σ_X^2, σ_Y^2 are known, then $\frac{(\bar{X}-\bar{Y})-(\mu_X-\mu_Y)}{\sqrt{\frac{\sigma_X^2}{n_1}+\frac{\sigma_Y^2}{n_2}}} \sim N(0,1)$, and $I_{\mu_X-\mu_Y} = (\bar{x}-\bar{y}) \mp z_{\alpha/2} \cdot \sqrt{\frac{\sigma_X^2}{n_1}+\frac{\sigma_Y^2}{n_2}}$.

$\boxed{\text{case 1.2}' \ (n_1, n_2 \geq 30)}$ For any independent populations X and Y, it holds that

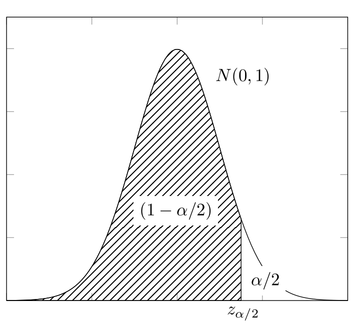
$$\frac{(\bar{X}-\bar{Y})-(\mu_X-\mu_Y)}{\sqrt{\frac{\sigma_X^2}{n_1}+\frac{\sigma_Y^2}{n_2}}} \sim N(0,1) \text{ and}$$

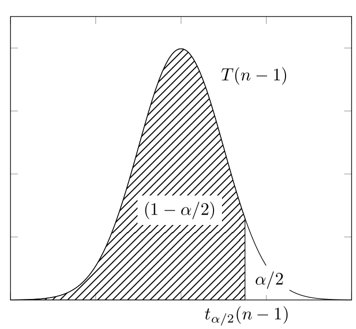
$$I_{\mu_X-\mu_Y} = (\bar{x}-\bar{y}) \mp z_{\alpha/2} \cdot \sqrt{\frac{\sigma_X^2}{n_1}+\frac{\sigma_Y^2}{n_2}} \text{ or } I_{\mu_X-\mu_Y} = (\bar{x}-\bar{y}) \mp z_{\alpha/2} \cdot \sqrt{\frac{\hat{\sigma}_X^2}{n_1}+\frac{\hat{\sigma}_Y^2}{n_2}}.$$

$\boxed{\text{case 1.3}' \text{ (any } n_1, n_2)}$ If independent populations $X \sim N(\mu_X, \sigma_X^2), Y \sim N(\mu_Y, \sigma_Y^2)$, where σ_X^2, σ_Y^2 are unknown but $\sigma_X^2 = \sigma_Y^2$, then

$$\frac{(\bar{X}-\bar{Y})-(\mu_X-\mu_Y)}{S\sqrt{\frac{1}{n_1}+\frac{1}{n_2}}} \sim T(n_1+n_2-2), \text{ where } S^2 = \frac{(n_1-1)S_X^2+(n_2-1)S_Y^2}{n_1+n_2-2}, \text{ and}$$

$$I_{\mu_X-\mu_Y} = (\bar{x}-\bar{y}) \mp t_{\alpha/2}(n_1+n_2-2) \cdot s\sqrt{\frac{1}{n_1}+\frac{1}{n_2}}.$$





CI-2: $(1-\alpha)$ CI of population variance(s) σ^2

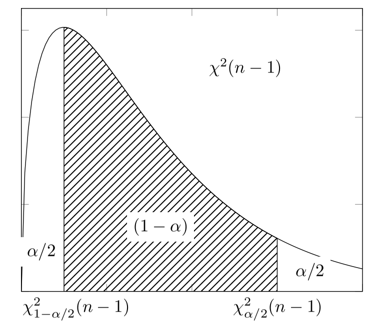
• If a population $X \sim N(\mu, \sigma^2)$ and σ^2 is unknown, then $\frac{(n-1)S^2}{\sigma^2} \sim \chi^2(n-1)$, and

$$I_{\sigma^2} = \left(\frac{(n-1)s^2}{\chi^2_{\alpha/2}(n-1)}, \quad \frac{(n-1)s^2}{\chi^2_{1-\alpha/2}(n-1)}\right).$$

• If two independent populations $X \sim N(\mu_X, \sigma^2)$ and $Y \sim N(\mu_Y, \sigma^2)$, and σ^2 is unknown, then $\frac{(n_1+n_2-2)S^2}{\sigma^2} \sim \chi^2(n_1+n_2-2)$, and

$$I_{\sigma^2} = \left(\frac{(n_1+n_2-2)s^2}{\chi^2_{\alpha/2}(n_1+n_2-2)}, \quad \frac{(n_1+n_2-2)s^2}{\chi^2_{1-\alpha/2}(n_1+n_2-2)}\right),$$

where $S^2 = \frac{(n_1-1)S_X^2+(n_2-1)S_Y^2}{n_1+n_2-2}$.



CI-3: $(1-\alpha)$ CI of population proportion(s)

• If a (large) population has an unknow proportion p, then $\frac{\hat{P}-p}{\sqrt{p(1-p)/n}} \sim N(0,1)$ if $n\hat{p} \geq 10$ and $n(1-\hat{p}) \geq 10$ with $\hat{p} = x/n$, and $I_p = \hat{p} \mp z_{\alpha/2} \cdot \sqrt{\frac{\hat{p}(1-\hat{p})}{n}}$.

• If two independent (large) populations have unknow proportions p_1 and p_2, then

$$\frac{(\hat{P}_1-\hat{P}_2)-(p_1-p_2)}{\sqrt{\frac{p_1(1-p_1)}{n_1}+\frac{p_2(1-p_2)}{n_2}}} \sim N(0,1)$$

if $n_i\hat{p}_i \geq 10$ and $n_i(1-\hat{p}_i) \geq 10$ for $i = 1, 2$, and $I_{p_1-p_2} = (\hat{p}_1-\hat{p}_2) \mp z_{\alpha/2} \cdot \sqrt{\frac{\hat{p}_1(1-\hat{p}_1)}{n_1}+\frac{\hat{p}_2(1-\hat{p}_2)}{n_2}}$.

7. Hypothesis Test (HT)

	H_0 is true	H_0 is false and $\theta = \theta_1$
reject H_0	(type I error or significance level) α	(power) $h(\theta_1)$
don't reject H_0	$1-\alpha$	(type II error) $\beta(\theta_1) = 1 - h(\theta_1)$

$$\text{reject } H_0 \Leftrightarrow TS \in C \Leftrightarrow p\text{-value} < \alpha$$

χ^2 tests for populations (non-parametric tests)

Suppose that for a random sample of a population X, the n elements of it are classified into k disjoint groups $A_i, 1 \leq i \leq k$. For each group $A_i, 1 \leq i \leq k$, suppose that there are $N_i, 1 \leq i \leq k$ elements inside. Let $p_i = P(A_i)$ assuming a given distribution of X. Note that $p_1 + p_2 + \ldots + p_k = 1$ and $N_1 + N_2 + \ldots + N_k = n$. One wants to test the hypotheses

$$H_0 : P(A_i) = p_i, \ 1 \leq i \leq k, \quad H_a : P(A_i) \neq p_i \text{ for some } 1 \leq i \leq k.$$

If n is large in the sense that $np_i \geq 5$ for all $1 \leq i \leq k$, then the test statistic is

$$\sum_{i=1}^{k} \frac{(N_i - np_i)^2}{np_i} \approx \chi^2(k-1).$$

Therefore the observation of the test statistic is

$$TS = \sum_{i=1}^{k} \frac{(n_i - np_i)^2}{np_i}, \text{ where } n_i \text{ is the observation of } N_i, 1 \leq i \leq k.$$

For the critical region C, one can take (note that if H_0 is true, then TS should be close to zero)

$$C = (\chi^2_\alpha(k-1),\ \infty).$$

The conclusion would be $TS \in C \iff H_0$ is rejected.

8. Linear and logistic regression

(Multiple) linear regression: $Y = \beta_0 + \beta_1 x_1 + \ldots + \beta_k x_k + \varepsilon, \quad \varepsilon \sim N(0, \sigma^2)$.

- Y : response variable (which is normal r.v.), $\{x_1, \ldots, x_k\}$: predictors (which are scalars).
- sample: $\{(x_{11}, \ldots, x_{1k}; y_1), (x_{21}, \ldots, x_{2k}; y_2) \ldots, (x_{n1}, \ldots, x_{nk}; y_n)\}$.
- how to estimate $\beta_j \approx \hat{\beta}_j$: least square method, that is, to minimize $\sum_{i=1}^n (\hat{y}_i - y_i)^2$, where the estimated (multiple) linear regression line $\hat{y}$ is

$$\hat{y} = \hat{\beta}_0 + \hat{\beta}_1 x_1 + \ldots + \hat{\beta}_k x_k.$$

- $\frac{\hat{\beta}_j - \beta_j}{se(\hat{\beta}_j)} \sim T(n-k-1)$, this helps determine whether or not the real $\beta_j = 0$?
- $\sigma^2 \approx \frac{SS_E}{n-k-1}$, this gives an estimation of the size of the error.
- $R^2 = \frac{SS_R}{SS_T}$, this gives how well the model is (if $R^2 \approx 1$, then the model fits the sample very well).
- How to test $\beta_1 = \ldots = \beta_k = 0$? Use the random variable $\frac{SS_R/k}{SS_E/(n-k-1)} \sim F(k, n-k-1)$.

Logistic regression: Let Y can only take 0 or 1 with $P(Y=1) = p$ and $P(Y=0) = 1-p$,

$$E(Y) = p(x_1, \ldots, x_k) = \frac{e^{\beta_0 + \beta_1 x_1 + \ldots + \beta_k x_k}}{1 + e^{\beta_0 + \beta_1 x_1 + \ldots + \beta_k x_k}}.$$

- Y : response variable (which is Bernoulli r.v. $P(Y=1) = p$ and $P(Y=0) = 1-p$, so $E(Y) = p$), $\{x_1, \ldots, x_k\}$: predictors (which are scalars).
- sample: $\{(x_{11}, \ldots, x_{1k}; y_1), (x_{21}, \ldots, x_{2k}; y_2) \ldots, (x_{n1}, \ldots, x_{nk}; y_n)\}$.
- how to estimate $\beta_j \approx \hat{\beta}_j$: maximal likelihood method (maximize $\prod_{i=1}^n p(x_{i1}, \ldots, x_{ik})^{y_i} (1 - p(x_{i1}, \ldots, x_{ik}))^{1-y_i}$).
- $\frac{\hat{\beta}_j - \beta_j}{se(\hat{\beta}_j)} \approx N(0,1)$ for large $n \geq 30$, this helps determine whether or not the real $\beta_j = 0$?
- Classification of a new object $Y(x_1, \ldots, x_k)$ as 1 or 0 according

$$Y(x_1, \ldots, x_k) = \begin{cases} 1, & \text{if } \hat{p}(x_1, \ldots, x_k) \geq 0.5, \\ 0, & \text{if } \hat{p}(x_1, \ldots, x_k) < 0.5, \end{cases}$$

where the estimated logit function $\hat{p}(x_1, \ldots, x_k)$ is

$$\hat{p}(x_1, \ldots, x_k) = \frac{e^{\hat{\beta}_0 + \hat{\beta}_1 x_1 + \ldots + \hat{\beta}_k x_k}}{1 + e^{\hat{\beta}_0 + \hat{\beta}_1 x_1 + \ldots + \hat{\beta}_k x_k}}.$$

9. Tables

(9.1) Table for $N(0,1)$ standard normal random variable $\Phi(x) = P(N(0,1) \leq x),\ \ x \geq 0$.
There is an important relation $\Phi(-x) = 1 - \Phi(x),\ \ x \geq 0$.

(9.4) Table for Binomial random variable $P(Bin(n,p) \le k)$ if $p \le 0.5$.
If $p > 0.5$, then $P(Bin(n,p) \le k) = P(Bin(n, 1-p) \ge n-k)$.
